

TECHNICAL SOLUTIONS TO REDUCE AIR POLLUTION IN SPAIN

- Use of renewable energy
- Measures in relation to the reuse of resources and recycling are also essential.
- Installation of charging points for electric cars

CLEAN ENERGIES

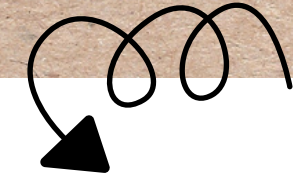

Invest in renewable energy

Reduce emissions in our centers

Reduce your carbon footprint

Recycle the things we value

Air pollution is a significant problem in Spain, particularly in urban areas, due to factors such as traffic, industrial activity, and climate conditions. This has led to negative impacts on public health, including respiratory and cardiovascular issues. The Spanish government has implemented measures to reduce air pollution, such as promoting clean energy, regulating emissions, and improving public transportation infrastructure. However, there is still a need for ongoing efforts to improve air quality and protect public health in Spain.
